

Tuan · delivery crib · slides 6–10

Personal copy, short lines only — the shared scripts are unchanged. Your simplified wording with the three evidence-discipline fixes applied: "**we can't say yes**" (not "no"), "**no strong evidence**" (not "no results"), and the close scoped to "in this data ... **carries the signal**" (not "drives"). Roughly 460 words ≈ 3:30 at 130 wpm for your half.

Cue: Sophia ends Slide 5 with "...the question we actually came here to answer. Tuan —"

Slide 6 · What survives scrutiny · ~55s

Thanks, Sophia. Now — does the story actually matter?

Our honest answer: **we can't say yes**.

None of our findings about story writing are strong enough to recommend changes.

At first, **urgency** words looked like a clear win.

But once we grouped the data **by country**, that effect completely disappeared.

Next, **family** stories seemed to help in two areas —

Palestine and Yemen, plus Honduras and Nicaragua.

However, each group covers **only two countries** — neither passed our strict statistical test.

So this is **an idea to test later, not a proven fact**.

Finally, positive or negative **tone** gave different answers in different models — **genuinely open**.

In the end, we would rather say "**no strong evidence**" than promote an exciting finding we cannot defend.

Slide 7 · Beyond keywords · ~35s

Next, we looked beyond simple keywords.

We found **eight** main story themes —

and funding speed changes up to **nine times** between them.

Clean-water stories fund in under **two days**; group farming takes nearly **two weeks**.

However, these themes simply describe **what the loan is for**.

That is real-world structure — not persuasive writing.

So Kiva should review how loan **purposes** are categorized, not just broad sectors.

And what should the platform actually do?

Slide 8 · What this means in practice · ~1m15s

We suggest **three clear steps** — plus one guardrail.

First: do not ship writing advice.

We found no reliable evidence it helps — that saves time for the content team and for borrowers.

Larger loans do take longer to fund —

but **96%** of loans are paid out **beforehand**,

so that is **partner cash flow**, not borrower waiting time.

We should **never tell people to ask for less money**.

Second: run an experiment, not a rollout.

In Palestine, Yemen, Honduras and Nicaragua —

a simple **A/B test**: family prompt versus the standard page.

Test it before launching it.

Third: review how slower **programs**, sectors and regions are highlighted on the site.

These structural gaps are **ten times** the size of any wording effect.

And the guardrail: our prediction tool stays a **test model**

until data science retrains it on **all loans** — including **expired ones**.

[advance to the borrower page]

And this page is simply what that means for borrowers —

what to expect, not what to game.

Slide 9 · What this can't tell us · ~25s

To be fair, we have three clear limits.

First — we show **connections, not direct causes**.

Second — we only observed loans that **succeeded**, not loans that failed.

Third — our text analysis used **simple rules**, not deep human nuance.

Being honest about these limits is why you can trust what we **do** report.

Slide 10 · Closing · your line

In this data, the story barely moves the needle —

it is the loan's structure that **carries the signal**.

(Sophia closes: "And testing hard enough to say, honestly, that there is **no robust evidence** for the story — that's worth more to a platform than a good-sounding tip. Thank you — we're happy to take your questions.")

If a judge quotes the p6 headline ("won't move the needle") back at you:

"The precise version is the sub-line — no narrative result is robust enough to support a recommendation. Absence of robust evidence, **not proof of no effect**."

If **pressed on the table (p6)**: the slide shows **0.44** — that's the notebook fit; the authoritative pipeline gives **0.49** — **same direction, same conclusion**.
